Abstract:

DE 2424681 A

Plasticised thermoplastic (co)polyamide materials contain 0.1-2 wt. %, based on total material, of hydrochloric or sulphuric acid, or an amine salt of these acids. The additive enables the properties of the plasticised (co)polyamide to be varied between finely crystalline, tough materials, when hydrochloric acid or one of its salts is used, and coarsely crystalline, brittle materials, when sulphuric acid or one of its salts is used. The latter materials can be easily comminuted.
